

Solar Process

The process that each account goes through from point A to Z

1. Proposal
2. Close won
3. Contract Received and Completed (CRC)
4. Site Audit (scheduled 2-3 after signed agreement)
5. Final layout (Completed about a week after site audit complete)
6. Building Permit submitted (Varies by town/county)
7. Permit received (varies by town and county)
8. Installation (1-2 days to complete)
9. Final inspection (1-2 weeks after install)
10. Permission to Operate (PTO) (30 days after install)

Proposal: In order for a homeowner to receive a proposal they would talk to the solar consultant and provide the necessary information in order to generate a solar design for their home.

Info needed for a proposal

- Name on the title of the home
- Telephone
- Email
- Utility bill with consumption graph

If the home has no usage history, use a load calculator to estimate home electrical consumption. Get familiar with your state's and utility's guidelines for solar offset. Some states allow 110% solar offset of the previous year, some states allow up to 120% so do some research on the market and utility company you're working in so you're knowledgeable about what you can and cannot do for your customer.

Closed Won: For deal, submission Verify that the following documents have been obtained to move the project forward:

- Installation agreement signed
- Loan Documents signed (ACH, Welcome call)
- Interconnection Documents signed
- Utility Bill

Solar Process

There will be times where your customer might need to provide more documents to verify for the finance company and to apply for permits.

These are the documents that are requested for approval:

- Title or deed of the home
- Tax bill
- Land survey
- Last year's Taxes to verify income

Contract Received and Complete: All documents needed have been approved and everything has been verified to start working on the project. Once your account has been CRC you will be approved for your M1 commission payment. Verify with your manager if you will get your M1 at CRC, Building Permit Submitted. If you get paid at Install you will receive your full commission once the installation is complete. M1 you'll get paid out 30% of full commission with a cap of \$2000 and will receive the rest of your commission at M2 which is installation complete. M1 (Milestone 1) M2 (Milestone 2).

Site Audit: Site Audits are complete 48-72 hours after deal submission. We want to get the site audit done ASAP.

For Best practice please set your customer up for success by setting proper expectations of the Site Audit. For on-site audits, the team will get on the roof and get proper measurements of the roof and the condition of the roof. They will need access to the main electrical panel and attic. A person above the age of 18 must be present when the site audit team is there.

The roof must be qualified by our engineer to move forward for installation.

If the roof is in bad condition we can provide a roof replacement in order for the customer to be approved for installation. Quotes are provided when a request has been made for one.

The roof replacement quote will be added to the solar loan and new installation and loan documents will be generated and emailed to the customer for signature, this is called a change order.

What prompts a change order?

- Main Electrical Panel Upgrade
- Roof in bad condition
- Adding or removing panels from the original contract agreement.

Solar Process

All of these changes will increase or decrease monthly payments. If no changes are needed the project will be moved forward to the following stage.

Final Layout/CAD approval: CAD should be completed within a week after site audit complete.

A CAD document approved by an engineer to be sent for building permit will be emailed to the homeowner for approval. This will show the final placement of the solar system and final scope of work of the project.

Permitting: Times for permitting depends on the customer's township or county. Some markets and towns are easier than others. Best practice is advised to tell the homeowner that permits can take anywhere from 2-4 weeks to be approved. There are towns that provide permits within a week or a couple of days so do your research to provide your customer with proper expectations. We have no control over how long the town or county takes to approve permits. If permitting is taking longer than usual you can always have the customer call the building department to see what's holding up the approval.

The utility company will also be contacted to prep home for solar interconnection. If a home does not have a new meter, the old meter will be replaced by the electrical company with a new solar net meter which is bi-directional.

Once we receive a permit for the solar installation from the town or county building department the EPC provider will contact the customer to schedule an installation date.

Installation:

A person over the age of 18 must be present. Homeowners are always advised to be there so the installation crew can walk them through what will be done for the day. Installations are usually completed in one day but could take 2 days for larger systems. Power will be cut off for a couple of hours to connect the solar system with the main electrical panel. If installing ground mount or on a garage roof, trenching will be required. Reps are advised to be there for solar installation day to knock on neighbors doors to acquire new business or acquire Referrals from homeowners.

Final Inspection:

City inspector and utility company will go out to check that proper installation guidelines were followed by the installation crew. Once final inspection has been done and approved, the homeowner will be emailed or a letter will be sent to them with a PTO date. PTO day will begin the first day of service with the solar system.

Solar Process

PTO: Congratulations!!! On this day your customer will start producing their own power and they will start getting credited for their overproduction. This will be their anniversary date so depending on utility policy they will either reset back to zero for energy credits or receive a small check for over produced energy. Research the solar policy for the particular utility company your customer is working with.

All homeowners will start paying their solar monthly payments 30-60 days after installation date or PTO date whichever comes first.
